

## **Insecticides for storage protection**

Stored product protection - a small but fine speciality of plant protection - a topic that hentschke + sawatzki has been dealing with successfully for decades. The preservation and protection of plant-based stored goods for human consumption has naturally occupied mankind for many centuries. It depends on this whether the agricultural yields are preserved for mankind or destroyed by pests.

Our product portfolio is reduced to products for the control of insects harmful to stored products, although of course rodent pests can also become extremely dangerous for grain, for example.

We offer our customers the entire spectrum of available storage protection agents (except fumigants). All our products - like all modern pesticides - are highly specialised in their intended use. They follow the respective steps of storage and stockpiling. Our range includes preparations for:

- [COLD AND HOT FOGGING](#) - Behandlung des Raumes bei Befall von Vorratsgütern, die sich während der insektiziden Behandlung ungeschützt im Raum befinden (Vernebelungspräparate im Kalt- und Heißnebelverfahren sowie Aerosole/Nebelautomaten),
- [MATERIAL FLOW TREATMENT](#) - treatment of the room in case of infestation of stored goods which are unprotected in the room during the insecticidal treatment (fogging preparations in cold and hot fogging process as well as aerosols/aerosol-foggers),
- [EMPTY SPACE TREATMENT](#)
